Installation Manual

105U-L Wireless I/O

Version 1.8

man_105U-L_installation_v1.6.doc
Limited lifetime warranty, disclaimer and limitation of remedies

ELPRO products are warranted to be free from manufacturing defects for the “serviceable lifetime” of the product. The “serviceable lifetime” is limited to the availability of electronic components. If the serviceable life is reached in less than three years following the original purchase from ELPRO, ELPRO will replace the product with an equivalent product if an equivalent product is available.

This warranty does not extend to:

- Failures caused by the operation of the equipment outside the particular product's specification, or
- Use of the module not in accordance with this User Manual, or
- Abuse, misuse, neglect or damage by external causes, or
- Repairs, alterations, or modifications undertaken other than by an authorized Service Agent.

ELPRO’s liability under this warranty is limited to the replacement or repair of the product.

This warranty is in lieu of and exclusive of all other warranties. This warranty does not indemnify the purchaser of products for any consequential claim for damages or loss of operations or profits and ELPRO is not liable for any consequential damages or loss of operations or profits resulting from the use of these products. ELPRO is not liable for damages, losses, costs, injury or harm incurred as a consequence of any representations, warranties or conditions made by ELPRO or its representatives or by any other party, except as expressed solely in this document.

Safety information

Thank you for selecting the 105U-L for your telemetry needs. We trust it will give you many years of valuable service.

To ensure your 105U-L enjoys a long life, double-check ALL your connections with the Installation Guide before powering on the module.

**WARNING:** Incorrect termination of supply wires may cause internal damage and will void warranty.

---

**IMPORTANT ELECTRICAL SAFETY INFORMATION**

In order to comply with Electrical Safety Regulations, this module must be installed in an Electrical AND Fire enclosure. This enclosure may be a single or multiple enclosures. Access to the module is to be made by a Service Person only.

---

**Hazardous Location Notices:**

This device complies with

Ex nL IIC. T6 -40 C <= Ta <= +60 C

**WARNING:** EXPLOSION HAZARD.

Do not disconnect equipment unless power has been switched off or the area is known to be non-hazardous

---

**About this document**

This document is the 105U-L Wireless I/O Installation Manual that describes how to install your 105U-L units and contains important information for installing your units with other equipment.

**Note**

If your network only contains one transmitter and receiver pair, you should also read the 105U-L QuickStart Guides.

This document contains the following sections:

<table>
<thead>
<tr>
<th>Section</th>
<th>Read this section if you want to …</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic steps for using your unit</td>
<td>Learn the basic steps for installing and using your unit.</td>

<td>Testing your units on page 34.</td>
</tr>
</tbody>
</table>

**Note**

To ensure internal surge protection works correctly, you must earth each unit using the Earth terminal.

For more information, see the next sections.
Unit components and connections

This section shows the components and terminal connections for the transmitter and receiver units.

Transmitter unit

The 105U-L-T transmitter unit has the following components and terminal connections:
The front panel contains the following components:

![Diagram of front panel components](image)

The triangle on the rotary switch indicates the current position, for example:

<table>
<thead>
<tr>
<th>Position 0</th>
<th>Position 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>5</td>
</tr>
<tr>
<td>6</td>
<td>6</td>
</tr>
<tr>
<td>7</td>
<td>7</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
</tr>
</tbody>
</table>

**NOTE**: To avoid damaging the rotary switch, use a screwdriver to change the position. The rotary switch controls the setpoint levels on the Analog and Thermocouple inputs.
The LEDs on the front panel indicate the unit status:

<table>
<thead>
<tr>
<th>LED Status</th>
<th>Indicates</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>No power supply.</td>
</tr>
<tr>
<td>OK LED Green</td>
<td>Current status of the unit OK.</td>

<td>Analog Setpoint is active.</td>
</tr>
<tr>
<td>AZ</td>
<td>Analog Input is zero mA</td>
</tr>
<tr>
<td>All LEDs medium flash</td>
<td>Medium speed flash (1.6HZ) indicates the module is halfway through the configuration process. Medium flash also happens when you set the rotary switch to position 0 when powering on the unit.</td>
</tr>
</tbody>
</table>
Receiver unit

Your 105U-L-R unit has the following components and terminal connections:

Max. 30VDC 500mA
For inductive load, use surge diodes

Max. analog load 900 ohm

DO contacts are rated at 1A, 250VAC
For good engineering practice, use a surge diode for DC loads and a surge capacitor (10nF 250V) for AC loads
The front panel contains the following components:

![Front Panel Image]

The LEDs on the front panel indicate the unit status:

<table>
<thead>
<tr>
<th>LED Status</th>

<td>Yagi antennas on page 17.</td>
</tr>
</tbody>
</table>

For more information, see the next sections.

Supported antennas

You can use the following antennas with the units:

<table>
<thead>
<tr>
<th>Antenna</th>
<th>Additional information</th>
<th>Total gain (including cable)</th>
</tr>
</thead>
<tbody>
<tr>
<td>WH900</td>
<td>Whip antenna for mounting directly onto the module - operation up to ½ mile (1 km).</td>
<td>-6 dBi</td>
</tr>
<tr>
<td>CFD890EL</td>
<td>0 dBi Dipole antenna with 15’ of Cellfoil cable and SMA connector.</td>
<td>0 dBi</td>
</tr>
<tr>
<td>SG900EL</td>
<td>5dBi Collinear omni-directional antenna with N-type connector.</td>
<td>5 dBi</td>
</tr>
<tr>
<td>SG900-6</td>
<td>8dBi Collinear omni-directional antenna with N-type connector.</td>
<td>8 dBi</td>
</tr>
<tr>
<td>YU6/900</td>
<td>10dBi Yagi directional antenna with N-type connector.</td>
<td>10 dBi</td>
</tr>
<tr>
<td>YU16/900</td>
<td>15dBi Yagi directional antenna with N-type connector.</td>
<td>15 dBi</td>
</tr>
</tbody>
</table>

You can use the following cables with the units:

The following table shows compatible cables for different antennas when used with the 105U-L-T:

<table>
<thead>
<tr>
<th>Antenna</th>
<th>North America</th>
<th>Australia/NZ</th>
</tr>
</thead>
<tbody>
<tr>
<td>SG900EL</td>
<td>Any cable.</td>
<td>CC10 or CC20.</td>
</tr>
<tr>
<td>SG900-6</td>
<td>Any cable.</td>
<td>CC20.</td>
</tr>
<tr>
<td>YU6/900</td>
<td>CC20.</td>
<td>External cable with loss &gt; 9dB.</td>
</tr>
<tr>
<td>YU16/900</td>
<td>External cable with loss &gt; 9dB.</td>
<td>External cable with loss &gt; 15 dB</td>
</tr>
</tbody>
</table>
You must carefully select antennas for 105U-L-T modules to avoid contravening the maximum power limit on the unlicensed channel. The net gain of the antenna/cable configuration should be no more than 6dB in North America (USA, Canada, Mexico) and no more than 0 dB in Australia / New Zealand.

**Note**

The net gain of an antenna/cable configuration is the gain of the antenna (in dBi) less the loss in the coaxial cable (in dB).

For example, an SG900-6 antenna with a CC20/900 cable has a net gain of 2dB (i.e. +8 dB – 6 dB) at 900 MHz.

The 105U-L-R module has no limitation on antenna gain, as this module does not incorporate a radio transmitter.

The following table details the gains of some typical antennas:

<table>
<thead>
<tr>
<th>Antenna</th>
<th>Gain (dBi)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dipole with integral 3m cable</td>
<td>0</td>
</tr>
<tr>
<td>Dipole without cable</td>
<td>2</td>
</tr>
<tr>
<td>5dBi Collinear (3dBd)</td>
<td>5</td>
</tr>
<tr>
<td>8dBi Collinear (6dBd)</td>
<td>8</td>
</tr>
<tr>
<td>3 element Yagi</td>
<td>5</td>
</tr>
<tr>
<td>6 element Yagi</td>
<td>10</td>
</tr>
</tbody>
</table>

The following table details losses for typical cables:

<table>
<thead>
<tr>
<th>Cable</th>
<th>Loss (dB per 10m) at 900 MHz</th>
</tr>
</thead>
<tbody>
<tr>
<td>RG58</td>
<td>-5</td>
</tr>
<tr>
<td>RG213</td>
<td>-2.5</td>
</tr>
<tr>
<td>Cellfoil</td>
<td>-3</td>
</tr>
</tbody>
</table>
Radio transmission distances

The unit will operate reliably over large distances depending on the:

- Antenna type;
- Antenna location;
- Amount of radio interference; and
- Radio path obstructions (e.g. hills or trees).

Typical reliable distances are:

<table>
<thead>
<tr>
<th>Area</th>
<th>Distance</th>
<th>Additional information</th>
</tr>
</thead>
<tbody>
<tr>
<td>USA/Canada</td>
<td>20+ miles</td>
<td>6dB net gain antenna configuration permitted (4W Equivalent RF power permitted).</td>
</tr>
<tr>
<td>Australia/NZ</td>
<td>20+ km</td>
<td>Unity gain antenna configuration (1W Equivalent RF power permitted).</td>
</tr>
</tbody>
</table>

To achieve these distances, you must elevate at least one site on a hill or transmission tower.

Modules will operate reliably with some radio path obstruction; however obstructions also reduce the reliable distance.

**Note**

You must test all obstructed paths to check the reliability of the path.

You can achieve maximum transmission distances if the radio path has “line of sight”. For example, raising antennas above intermediate obstructions including hills, trees, etc. Obstructions reduce the range; however they may not prevent a reliable path.

The closer the obstruction is to the antenna, the greater the blocking effect. For example, a group of trees around the antenna is a larger obstruction than a group of trees further away from the antenna. You can achieve longer distances by mounting one antenna on top of a hill.

**Note**

Due to the earth’s curvature, you must elevate antennas higher than the ground level between the antennas for longer paths (greater than 3 miles / 5 km).

The unit can tolerate larger amounts of obstructions for shorter distances. For very short distances, you can also mount the antennas inside buildings.

If two 105 modules cannot communicate reliably, you can use a third 105 module as a “repeater” to receive and re-transmit messages. This module may also have input/output (I/O) signals connected to it and form part of the I/O network.

**Note**

1. ELPRO recommends using the 105-G module as a repeater unit between 105U-L-T and 105U-L-R modules.

2. To use a repeater unit, the 105U-L modules and the repeater module must be configured using the supplied configuration software. The factory default configuration described in the Quick Start Guide cannot use a repeater unit.
Installing and earthing antennas

You must connect an antenna to each 105 module using the SMA connector at the top of the enclosure.

ELPRO recommends carefully taping the connections between the antenna and coaxial cable to prevent moisture ingress. Moisture ingress in the coaxial cable is a common cause of radio system problem as it greatly increases the radio losses.

ELPRO recommends taping the connection with three layers of tape:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Tape</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PVC tape.</td>
</tr>
<tr>
<td>2</td>
<td>Vulcanising tape (e.g. 3M 23 tape).</td>
</tr>
<tr>
<td>3</td>
<td>Additional layer of PVC UV-stabilized insulating tape.</td>
</tr>
</tbody>
</table>

The first tape layer lets you easily inspect the joint if required as you can easily remove the vulcanising seal.

Note

You must effectively earth all masts for mast-mounted antennas to avoid lightning surges. We also recommend using a coaxial surge diverter for antennas mounted outside industrial plant environments.

If the antenna is not already shielded from lightning strike by an adjacent earthed structure, you can provide shielding by installing a lightning rod above the antenna.

You should connect the antenna to the module using 50 ohm coaxial cable (e.g. RG58 or RG213) terminated with a male coaxial connector, The higher the antenna is mounted, the greater the transmission range; however as the length of coaxial cable increases so do cable losses. For use on unlicensed frequency channels, there are several types of antenna suitable for use.

If you mount antennas on elevated masts, you should effectively earth the masts to avoid lightening surges. The 105U-L radios are fitted with surge protection.

Note

For high lightening risk areas, ELPRO recommends additional surge suppression devices. If the antenna is not already shielded from lightening strike by an adjacent earthed structure, you can install a lightening rod to provide shielding.
Dipole and collinear antennas

This section contains important information for using dipole and collinear antennas. For more information, see the next sections.

Dipole antennas

Unity gain dipole antennas are commonly used on unlicensed channels. The dipole antenna does not provide any gain, so the power transmitted from the antenna is the same as the power out of the module.

A dipole antenna that comes supplied with integral 15 ft cable does not require additional coaxial cable.

You should mount dipole antennas vertically, preferably no less than 1 metre away from a wall or mast for maximum performance.

Collinear antennas

Collinear antennas transmit the same amount of radio power in all directions horizontally, and are easy to install and use. They provide gain by compressing the radiated signal to a flattened disc shape, and reducing the amount of signal radiated above and below the horizontal plane.

Collinear antennas are generally used at a central site with more than one remote site, or at a repeater site.

Collinear antennas are similar in appearance to dipole antennas; however the antenna is longer.

Collinear antennas are supplied without cable, and require additional coaxial cable.

You can use collinear antennas to:

- **Transmitter** – to compensate for the losses in long lengths of coaxial cable.
- **Receiver** – to increase receive sensitivity.
The following diagrams shows the recommended installation for collinear and dipole antennas:

- You must provide good ground connection to the mast, unit and surge arrester/protector.
- You must install the aerial above all local obstructions.
Yagi antennas

Yagi antennas are directional and have positive gain to the front of the antenna and negative gain in other directions. You can use the gain to:

- Compensate for coaxial cable loss for transmitter unit; and
- Increase receive sensitivity for receiver units.

You should install Yagi antennas with the central beam horizontal and pointed directly in the transmission direction to benefit from the antenna gain.

**Note**

Yagi antennas usually have a drain hole on the folded element. You should position the drain hole at the bottom when installing the antenna.

You can install Yagi antennas:

- Vertically polarized – with the elements in a vertical plane; or
- Horizontally polarized – with the elements in a horizontal plane.

The following table shows the recommended installation mode for different situations.

<table>
<thead>
<tr>
<th>If your installation has ...</th>
<th>ELPRO recommends using ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two stations both using Yagi antennas</td>
<td>• Horizontal polarization for the stations.</td>
</tr>
</tbody>
</table>
| Two or more stations communicating with a common station | • Vertical polarization for the stations; and
• Dipole or collinear (i.e. non-directional) antenna for the central station. |
The following diagrams show the recommended installation for collinear and dipole antennas:
Installing the power supply

The unit works with a 9-30 VDC 0.6 Amp CSA certified Class 2 power supply. For use in Class 1 Div 2 explosive areas, the power supply must be approved for Class 1 Div 2 use.

**Warning – explosion hazard**

Do not disconnect while circuit is live unless area is known to be non-hazardous.

The following table shows the power supply requirements:

<table>
<thead>
<tr>
<th>Power supply</th>
<th>105U-L-T</th>
<th>105U-L-R</th>
</tr>
</thead>
<tbody>
<tr>
<td>12V</td>
<td>600 mA</td>
<td>250 mA</td>
</tr>
<tr>
<td>24V</td>
<td>300 mA</td>
<td>125 mA</td>
</tr>
</tbody>
</table>

The power supply can be a floating supply or negatively grounded.

The transmitter provides a 24V DC regulated supply for analog loop power. The supply is rated at 35 mA and should ONLY be used for powering analog loops.

To install the power supply:

1. Connect the positive lead to **Power Supply Input**.
2. Connect the negative lead to **Ground**.

**Note**

To ensure internal surge protection works correctly, you must earth each unit using the Earth terminal.

You should connect the module to the same ground/earth point as the antenna mounting to avoid differences in earth potential during voltage surges.

Do NOT connect the positive side of the supply to Earth.

3. The following diagram illustrates the connection:
## Inputs and outputs

The units have the following inputs and outputs:

<table>
<thead>
<tr>
<th>Input/output</th>
<th>105U-L-T</th>
<th>105U-L-R</th>

<td>0-22 mA, suitable for loop powered, floating input or single-ended input device.</td>
<td>Analog output on page 29.</td>
</tr>
</tbody>
</table>

For more information, see the next sections.
**Digital inputs**

The 105U-L-T module provides two digital inputs suitable for:

- **Voltage free contacts** – e.g. mechanical switches; or
- **NPN transistor devices** – e.g. electronic proximity switches; or
- **0-5V signals** - 2V – 4V Minimum range.

**Note**

PNP transistor devices are not suitable.

The unit provides contact wetting current of approximately 5mA to maintain reliable operation of driving relays.

Each digital input is connected between the appropriate **Digital Input** terminal and **Ground**.

Each digital input circuit includes a LED indicator that lights when the digital input is active (i.e. when the input circuit is closed).

To activate the digital input, the switching device resistance must be less than 200 ohms.

<table>
<thead>
<tr>
<th>Connection method</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Voltage free contact</strong></td>
<td><img src="image1" alt="Diagram" /></td>
</tr>
<tr>
<td><strong>Active 0-5v signal device</strong></td>
<td><img src="image2" alt="Diagram" /></td>
</tr>
</tbody>
</table>

**Note**

Use a solid state relay if the voltage range is not suitable. **Voltage Range is low**: 2V (max); **high**: 4V (min).
**Relay outputs**

The 105U-L-R module provides three normally open voltage-free relay contacts rated at 250VAC / 30VDC 1A.

You can use these outputs to directly control low-powered equipment or power larger relays for higher-powered equipment.

For inductive loads, ELPRO recommends:

**DC relays** - use flyback diodes across the external circuit to prevent arcing across the relay contacts.

**AC relays** – use capacitors (e.g. 10nf 250V) to prevent arcing across the relay contacts.

You can individually configure digital outputs to turn off if no command message is received by the output for a certain period. This feature provides an intelligent watchdog for each output, so communications failure at a transmitting site causes the output to revert to a known state.

The output circuit is connected to the appropriate pair of Digital Output terminals. Each digital output circuit includes a LED indicator that lights when the digital output is active. The LED flashes if the watchdog alarm is active.

**IMPORTANT SAFETY INFORMATION**

In order to comply with Electrical Safety Standards, when connecting SELV AND voltages which are greater than SELV (30VAC or 60VDC) together, then Relay Output 2 must **NOT** be used in order to provide sufficient isolation between the outputs.
### Status outputs

The unit contains the following status outputs:

- **System OK**;
- **Setpoint Output**; and
- **Communications Failure**.

Status outputs are FET output to common rated at 30VDC 500 mA.

Connect the output circuit to the appropriate Status **Output** terminal. Each status output circuit is associated with an LED indicator that lights lit when the digital output is active.

#### Status output behavior

<table>

<td>Watchdog alarms active on digital outputs or analog outputs.</td>
</tr>
</tbody>
</table>
Analog input

The 105U-L-T module provides one 0 - 20 mA DC analog input for connecting to instrument transducers (e.g. level, moisture, pressure transducers, etc.).

**Note**

The 105U-L-T module inputs measure down to 0mA and can also be used for zero based signals (e.g. 0 - 10 mA).

The analog input has a positive and negative terminal and can be placed at any point in the current loop, providing neither input rises above the 24 volt Analog Loop Supply level.

Each input has a loop resistance of less than 250 ohms and zener diode protection is provided against over-voltage and reverse voltage.

**Note**

You may require additional protection in high voltage or noisy environments or for long wiring runs.

A 24VDC loop supply is available on the 105U-L-T module for powering the analog transducer loops. In this situation, connect the:

- **Analog loop** - between an Analog Input (-) terminal and Ground.
- **Positive terminal** – i.e. Analog Input (+) to the +24V Analog Loop Supply.

Externally powered loops may be connected by connecting the input between "Analog Input (+)" and “Analog Input (-)" Common mode voltage may be -0.5V to 27V.

ELPRO recommends using shielded cable for analog I/O loops to minimize induced noise and Radio Frequency Interference (RFI).

**Note**

You should only connect one end of the cable shield to Earth

To connect an analog signal from a PLC or DCS output to an analog input on the 105U-L-T, you must carefully check the internal circuit of the output as different devices use different ways to create an analog signal.
The following diagrams illustrate different connection methods:

<table>
<thead>
<tr>
<th>Analog signal source</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 wire transducer</td>
<td><img src="image1" alt="Diagram" /></td>
</tr>
<tr>
<td></td>
<td>Analog Loop Supply</td>
</tr>
<tr>
<td></td>
<td>Analog Input (+)</td>
</tr>
<tr>
<td></td>
<td>Analog Input (-)</td>
</tr>
<tr>
<td></td>
<td>Ground</td>
</tr>
<tr>
<td>4 wire transducer</td>
<td><img src="image2" alt="Diagram" /></td>
</tr>
<tr>
<td></td>
<td>External Power</td>
</tr>
<tr>
<td></td>
<td>4-20 mA</td>
</tr>
<tr>
<td></td>
<td>Analog Loop Supply</td>
</tr>
<tr>
<td></td>
<td>Analog Input (+)</td>
</tr>
<tr>
<td></td>
<td>Analog Input (-)</td>
</tr>
<tr>
<td></td>
<td>Ground</td>
</tr>
<tr>
<td>Current source output</td>
<td><img src="image3" alt="Diagram" /></td>
</tr>
<tr>
<td></td>
<td>Current Source Output</td>
</tr>
<tr>
<td></td>
<td>Analog Loop Supply</td>
</tr>
<tr>
<td></td>
<td>Analog Input (+)</td>
</tr>
<tr>
<td></td>
<td>Analog Input (-)</td>
</tr>
<tr>
<td></td>
<td>Ground</td>
</tr>
</tbody>
</table>

**Note**

*Analog input must be within 27V of Ground.*

*If your terminal voltage exceeds this, you must use a loop isolator.*

1. *Analog input must be within 27V of Ground.*
2. *Ground is connected to ground/earth.*

*If you cannot ground the PLC COM, you must use a loop isolator.*
<table>
<thead>
<tr>
<th>Analog signal source</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current sink output</td>
<td><img src="image" alt="Diagram" /></td>
</tr>
</tbody>
</table>

**Note**

1. Ground is connected internally to Earth.
   If you cannot ground the PLC COM, you must use a loop isolator.
**Thermocouple input**

The 105U-L-T provides one input suitable for connection to a thermocouple or a millivolt level signal. The module provides linearization tables for J, K and T type thermocouples and also supports other types via a user linearization table.

Millivolt signals in the range -10mV to +100 mV are supported.

For more information on configuring the thermocouple input and cold-junction compensation to suit your application, refer to the *User Manual*.

---

**Note**

The cable shield is optional; however ELPRO recommends cable shields for long cable runs.
Pulse input

The 105U-L-T module lets you configure the digital inputs as pulse inputs with the following characteristics:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum rate</td>
<td>10 Hz</td>
</tr>
<tr>
<td>Minimum off time</td>
<td>20 mSec</td>
</tr>
<tr>
<td>Minimum on time</td>
<td>20 mSec</td>
</tr>
</tbody>
</table>

Using this mode, you can map the pulse count to a remote output by transmitting the pulse count to a 105-G module register or re-generating as a Pulse Output on 105-1 or Digital Output on a 105-3 unit.

**Note**

You should connect the pulse input in the same way as a digital input.

The following diagrams illustrate different connection methods:

1. **Connection method**
   - Passive transistor
   - Active pulse device

2. **Example**
   - Passive Transistor Device
   - External Power Supply

3. **Diagrams**
   - Passive transistor diagram
   - Active pulse device diagram

   **Note**
   Use a solid state relay if the voltage range is not suitable. Voltage Range is low: 2V (max); high: 4V (min).
**Analog output**

The 105U-L-R module provides a 4 - 20 mA DC analog output for connecting to instrument indicators to display remote analog measurements. The analog output is a current source provided from an internally generated +24V loop supply.

When connecting to an external device (e.g. electronic indicator, recorder, PLC / DCS input, etc.) by connecting the output between the Analog Output terminal (+) and the COM terminal (-).

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zener protection of analog outputs provides protection against short periods of over-voltage; however longer periods may result in module damage.</td>
</tr>
</tbody>
</table>

You can also individually configure analog outputs to turn off (i.e. 0 mA) if no command message is received to the output for a certain period.

The following diagrams illustrate different connection methods:

<table>
<thead>
<tr>
<th>Connection method</th>
<th>Example</th>

Device
Installing and configuring the unit

This section describes how to install and configure your unit and contains the following sections:

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
<th>For more information, see …</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installing the unit</td>
<td>Describes how to physically install your unit.</td>
<td>Installing the unit on page 32.</td>
</tr>
<tr>
<td>Configuring your unit</td>
<td>Describes the different ways to configure your unit.</td>
<td>Configuring your units on page 33.</td>
</tr>
<tr>
<td>Testing your unit</td>
<td>Describes ELPRO’s recommendations for testing your unit.</td>
<td>Testing your units on page 34.</td>
</tr>
</tbody>
</table>

For more information, see the next sections.
Installing the unit

To install the unit:

1. Connect signals to the supplied terminals.
2. Connect the radio antenna.
3. Install DIN rail to mount the module.
4. Clip the module to the DIN rail:

You can now configure your unit. For more information, Configuring your units on page 33.
Configuring your units

You can configure your network using:

- **Default factory configuration** – that lets you easily setup your network as a simple send/receive; or
- **User-defined customized configuration** – that lets you set specific information about your network and allows communication with other ELPRO 105 series devices.

For more information on setting a user-defined customised configuration, see the *User Manual*.

For more information on setting the factory default configuration, refer to the *Quick Start Guide* included with your module.

The following table details the factory default configuration:

<table>
<thead>
<tr>
<th>Signals sent over radio</th>
<th>105U-L-T(Transmitter) Sends</th>
<th>105U-L-R (Receiver)</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
# Testing your units

We recommend you bench test the complete system before installing a new system. Configuration problems are easier to identify and fix when the units are next to each other.

The following table describes common problems and recommended solutions:

<table>
<thead>
<tr>
<th>If your installation has …</th>
<th>You should check …</th>
<th>ELPRO recommends …</th>
</tr>
</thead>
</table>
| Poor radio channel communications | • The antenna installation.  
• For radio interference on the same channel.  
• The radio path is adequate. | • Higher performance antennas if the path is too long.  
• Higher mounting points to overcome obstructions.  
• Using an intermediate unit as a repeater. |
| TX LED flashes but no RX LED  
Output LEDs flash quickly | | |
| Red OK LED | • Power Supply voltage | • Supply should be between 9 and 30VDC. |
| Analog loop supply current | • The analog loop supply is rated for 35 mA max. |
| Module configuration | • Your module configuration may be invalid. Re-load or restore factory default configuration. |
| TX LED flashes but no RX LED  
(bench testing) | • Ensure the 105U-L-R is set to the same country and frequency band as the 105U-L-T | • Register the receiver with the transmitter. (Refer to the Quick Start Guide) |
| RX LED Flashes but no outputs change | • For a user-defined customized configuration, - check the configuration. | • Check the configuration and re-program the modules. |
| | • For default configuration, check the receiver is registered with the transmitter. | • Repeat the procedure to register the receiver with the transmitter. |

For support for other testing issues, please contact ELPRO.
Unit specifications

Ancillary hardware reference information

This section contains reference information about additional hardware components you may need for your unit.

**RS232 serial cable**

You can connect the unit to a PC using an RS-232 serial cable to:

- Transfer configuration information;
- Perform factory and field-testing.

The serial port is an 8 pin RJ-45 plug that communicates using standard RS-232 signals:

<table>
<thead>
<tr>
<th>Signal information</th>
