1. General

⚠️ Assembly, start-up and operation of the device may only be performed by trained and experienced personnel familiar with this product.

According to these mounting and operating instructions, trained personnel refers to individuals who are able to judge the work they are assigned to and recognize possible dangers due to their specialized training, their knowledge and experience as well as their knowledge of the applicable standards.

Explosion-protected versions of this device may only be operated by personnel who have undergone special training or instructions or who are authorized to work on explosion-protected devices in hazardous areas.

Any hazards which could be caused in the control valve by the process medium, the operating pressure, the signal pressure or the moving parts are to be prevented by means of the appropriate measures.

The maximum permissible supply pressure may not be exceeded and must be limited by a supply pressure regulator, if necessary.

If inadmissible motions or forces are produced in the pneumatic actuator as a result of the supply air pressure level, it must be restricted by means of a suitable supply pressure reducing station.

Proper shipping and appropriate storage are assumed.

The solenoid valves may be mounted in any required position. The filter in the enclosure cover and the cable gland M20 x 1.5 must be mounted to face downwards or, in cases where this is not possible, mounted horizontally.

On mounting the solenoid valve, make sure that ≥ 300 mm clearance is kept above the enclosure cover.

If the solenoid valve is to be attached to rotary or linear actuators with a mounted positioner, the external air supply must be used connected over port 9.

The lowest permissible ambient temperature is –20 °C for Types 3701-xxxx xxxx 0 and –45 °C for Types 3701-xxxx xxxx 2.

The permissible ambient temperature range is lower for intrinsically safe devices according to the EC Type Examination Certificate PTB 01 ATEX 2178 and the Statement of Conformity PTB 02 ATEX 2014 X. Refer to pages 6 and 7 for more details.

Refer to Data Sheet T 3701 EN for technical data, ordering details, spare parts and accessories.

2. Attachment
Attachment to linear actuators

The Type 3701-xxx1 Solenoid Valve is designed for attachment according to IEC 60534-6 (NAMUR) and is attached directly to the yoke of the control valve with a M8 fastening screw (1) after the enclosure cover has been removed. Slide the washer and O-ring over the screw before fastening it.

For Series 240 Valves in DN 15 to 80 equipped with positioners or limit switches, an additional distance piece (2) is required. Distance piece and screw M8 x 90:
Order no. 1400-5905

For valves with rod-type yokes 18 to 35 mm, the solenoid valve is attached over a support (3) with clamping plate (4)
Order no. 1400-5342.
Attachment to rotary actuators

Version for adapter plate

The Type 3701-xxx2 Solenoid Valve is equipped in this version with bores for the output signal (1.3 and 2.3) at the back. An adapter plate (5) for the attachment and connection according to VDI/VDE 3845 is required on site (adapter plate with order no. 1400-5235).

The adapter plate is included in the scope of delivery for Type 3701-xxx0.

Mount first the adapter plate onto the NAMUR interface of the actuator. Prior to mounting, check to make sure the two O-rings are positioned correctly.

The operating direction is determined by a coding screw (6) M5 x 10 DIN 916 inserted in the connecting flange of the rotary actuator.

Two screws (7) M5 x 16 (DIN 912) are used to mount the adapter plate.

The mounting accessories are included in the scope of delivery.

Following this, mount the solenoid valve onto the adapter plate using the M8 screw with washer and O-ring. Check beforehand whether the two O-rings are positioned correctly in their recesses.

Mounting accessories

Screw (1) with washer and O-ring for the positioner:
Order no. 1400-5991

Note!

After mounting the solenoid valve, make sure that the vent plug located in the enclosure cover faces downwards when the control valve is mounted, or in cases where this is not possible, the vent plug must be positioned horizontally.
3. Pneumatic connection

Attach and route connection lines and screw fittings properly. Check them regularly for any leaks or damage and, if necessary, repair them. Prior to performing any repair work, relieve the connection line of pressure.

The supply air is connected over threaded bores with G 1/4 or 1/4 NPT depending on the version.

**Note:** The $K_{vs}$ coefficient of an upstream supply pressure regulator must be at least 1.6 times higher than the $K_{vs}$ coefficient.

**Connection line**

Refer to the table below for the minimum required nominal size of the connection line at the port 4 of the enclosure. The specifications apply to a connection line length $\leq$ 2 m. Use a larger nominal size for a connection line length $\geq$ 2 m.

<table>
<thead>
<tr>
<th>Pressure [bar]</th>
<th>Nominal size</th>
<th>$K_{vs}$</th>
</tr>
</thead>
<tbody>
<tr>

<td>$\geq$ 6</td>
<td></td>
</tr>
<tr>
<td>$\geq$ 2.5</td>
<td>$\geq$ 4</td>
<td>0.25</td>
</tr>
</tbody>
</table>

**Operating medium for the booster valve**

The internal supply air is connected over port 4 (delivery status): Instrument air, free of corrosive components, between 1.4 and 6 bar.

The external supply air is connected over port 9: Instrument air, free of corrosive components, lubricated air and non-corrosive gases, between 0 and 6 bar.

**Supply air for the pilot valve**

Instrument air, free of corrosive components, between 1.4 and 6 bar.

</tr>
</tbody>
</table>

**Changeover to external air supply connected over port 9**

The solenoid valve is delivered with the internal air supply connected over port 4. Convert to the external air supply connected over port 9 as follows:

Open the cover of the solenoid valve and un-thread screw on turnboard.

Turn the turnboard by 90°. The arrow must point to 9. Refasten screw.

4. Electrical connection

As far as the electrical installation of the device is concerned, the relevant national regulations governing the installation of electrical equipment and the national accident prevention regulations of the country of destination must be adhered to. In Germany, these are the VDE regulations and accident prevention regulations of the employer’s liability insurance. The required degree of protection to comply with IEC 60529 (2001) is only guaranteed when the enclosure cover is mounted, the exhaust air filters are installed and the electrical wiring has been connected correctly. For installation in hazardous areas, the following standards apply: EN 60079-14: 2003 (VDE 0165 Part 1) "Electrical apparatus for explosive gas atmospheres" and EN 50281-1-2: 1999 (VDE 0165
Part 2) "Electrical apparatus for use in the presence of combustible dust". For intrinsically safe electrical apparatus that are certified according to the Directive 79/196/EEC, the data specified in the certificate of conformity apply for connection of intrinsically safe circuits. For intrinsically safe electrical apparatus that are certified according to the Directive 94/9/EC, the data specified in the EC Type examination certificate apply for connection of intrinsically safe circuits.

The electrical supply is connected over a cable gland M20 x 1.5 to terminals in the enclosure or with a connector.

Connecting lead
We recommend using connecting leads with a wire cross-section of ≥ 0.5 mm². Connecting leads with an outer diameter between 6 and 12 mm are suitable for M20 x 1.5 cable glands.

Degree of protection
Devices with degree of protection IP 54 can be upgraded to degree of protection IP 65 by exchanging the filter in the enclosure cover.

1) The materials used for the filter and cable gland restrict the minimum permissible ambient temperature to −20 °C in Type 3701-8xxx xxxx 0.

Special conditions
The required degree of protection IP 54 according to IEC 60529 (2001) is only guaranteed when the enclosure cover is installed properly and the electrical wiring is connected correctly.
The wiring shall be connected in such a manner that the connection facilities are not subjected to tensile and/or torsional stress.
